The total circuit length includes both welding and ground leads (based on 4-volt drop) 60% duty cycle.

These values for current-carrying capacity are based on a copper temperature of  $60^{\circ}$ C ( $140^{\circ}$ F), an ambient temperature of  $40^{\circ}$ C ( $104^{\circ}$ F) and yield load factors from approximately  $32^{\circ}$ 6 for the No. 2 AWG cable to approximately  $23^{\circ}$ 6 for the No. 3/0 AWG cable, and higher for the smaller sizes. The sizes of cables generally used range from No. 2 AWG to No. 3/0 AWG. In actual service, the load factor may be much higher than indicated without overheating the cable, as the ambient temperature will generally be substantially lower than  $40^{\circ}$ C.
